

# SHARKS

There are about 370 different kinds of sharks. The great white shark is the most feared shark in the sea. The killer whale is the only animal that will try to eat it. The great white shark has bigger teeth than any other shark. One tooth is about the size of your hand. Believe it or not, sharks can grow as many as **30,000** new teeth in its life time. Another interesting shark is the whale shark. Although it is the biggest fish in the world, it is one of the most gentle. It is as long as two school buses lined up end to end. Some sharks are in danger of becoming extinct! Learning about them is the first step to saving them.
