

# ROBOTS

Robots are mechanical devices used to help people in many different ways. They are built to fit the jobs that they were made for. Most robots don't look like humans but they try to behave like humans. Most people think of robots as fighting machines with weapons, like in the movie Star Wars. But robots are not usually built to hurt people. Robots can be sent to outer space, dive under water, and even help doctors in surgery. The Stardust probe is a space robot on its way to meet a comet. It will arrive sometime in January 2004. It will bring back star dust and other particles from the comet. The Stardust probe will return to Earth in January 2006. Someday every family will have a robot in their house.
